## 1 Introduction

This user manual has been put together to guide you through accessing the pension switching element of the Comparator software.

Comparator is designed to give you the data needed to build a compliant switch process for investments and non-occupational pensions.

## 2 Logging in to Comparator

Comparator is a completely online system and can be accessed from any device that has an internet connection.

To use Comparator, you will need Microsoft Silverlight installed. If you don't have Microsoft Silverlight installed or are not sure, please visit: <http://www.microsoft.com/getsilverlight/>

If you don't have Silverlight installed, please install it, following the instructions provided. If Silverlight is already installed, and the version number is 3 or greater no further action is required.

Comparator is accessed via the Synaptic Software Limited website.

Go to [www.synaptic.co.uk](http://www.synaptic.co.uk) and scroll down the screen until you find the 'log in' option.

## Financial Services Research Software & Management Tools

Click on Synaptic.

This will take you to the Synaptic suite login page as shown below.

## Welcome

Please enter your security details. Unauthorised access could lead to prosecution.

If you don't have the required software to be able to use Comparator, once you try to log in a screen will appear to confirm which software will need to be installed for it to function.

3 Comparator

When you click on the Comparator tab, there are 5 options, 4 are calculators and the other is a research tool.

Click on Costs and Charges **Calculator** to start the research.

3.1 Costs and Charges Calculator

The Costs and Charges Calculator enables you to take the values and projected figures for your clients existing plans and recalculate them based upon any additional costs you believe should be taken into consideration. You can input additional charges as a fixed cost or % and specify the frequency it is taken.

It also now combines all projections to a unified term/age and calculates an appropriate amalgamated set of growth rates and maturity values based on the different figures the original projections were provided at.

In order for the calculator to work you must supply the following;

- A value the existing plans figures are calculated from (Initial Value)
- A term the existing figures are over (years and months)
- A contribution profile, if there are any regular contributions in the existing figures
- At least one set of existing figures (growth rate and maturity value (projection rate))

Once the calculator has these parameters it will calculate the RIY (reduction in yield) based off the existing figures.

It is also possible to specify a projection rate that uses a negative growth rate. The calculation will also use this rate when calculating the additional costs.

The calculator has been designed so that you can combine multiple existing plans into one amalgamated result set so that you can compare against a new plan within Comparator.

Adding Plans

To add plans into the Cost and Charges calculator from the Cost and Charges landing page press the  button.

‘To age’ when client selected

When adding a new plan you are presented with the screen below. *If a client has been selected* the term drop down becomes available and you can specify the term as ‘to age’. There is also a drop down to select how many growth rates you would like to use within the calculator. This drop down is only available on the first plan being added. All subsequent plans will need to have the same number of growth rates selected as the first plan input.

(No Client)

Costs & Charges Calculator

Enter the initial value, term and any existing contributions if applicable together with the growth rates and maturity values which have been supplied to you by the provider. You can then enter a set of additional charges to calculate what the figures supplied would be with the extra charges taken into account.

Name

Initial Value

----------	-----------	------------	-----

Projection Rates

Enter the growth rate and maturity values supplied by your existing provider. A reduction in yield will be automatically calculated, you may override this figure if it is supplied by the provider.

1 Rate	Growth Rate	Maturity Value £	Reduction in Yield (RIY)
	0.00%	£0.00	0.00%

Clear

Extra Costs

Once you have input the existing figures you can go on to specify any extra costs you wish to include. For example if you wanted to include fund charges then you could specify them as shown below;

Enter the growth rate and maturity values supplied by your existing provider. A reduction in yield will be automatically calculated, you may override this figure if it is supplied by the provider.

Growth Rate	Maturity Value £	Reduction in Yield (RIY)	Add +
5.00%	£25,489.48	1.94%	<div><div></div><div></div></div>

Additional Costs

Enter additional costs in the table below. Any costs with a frequency of "initial" will be taken off the initial value at outset. "£" costs should be entered as the amount per frequency, i.e. £10 monthly will take a £10 charge each month. "%" costs should be entered as the annual % cost we will then apply the proportion due per frequency to equate to the annual % cost.

Cost	Frequency	Indexation	Name	Reason	Add +
% 0.98%	Monthly	None ---	Fund TER	Not Included	<div><div></div><div></div></div>

Synaptic Fusion Version 3.1.144 Copyright © 2013 Capita Financial Software Ltd. | Accessibility

110%

You have the ability to define multiple charges both as a % or a fixed cost. A fixed cost should be entered as the amount per frequency, i.e. £10 monthly will take a £10 charge each month. % costs should be entered as the annual % cost, the system will then apply the proportion due per frequency to equate to the annual % cost.

Once you are satisfied that you have entered everything, press 

Add Plan

 and the calculator will work out what the maturity value would have been if the extra costs were taken into account for each of the projection rates supplied.

Plan 1 - £150000.00

3.3 Critical Yield Calculator

This calculator has two functions, one being the reverse of the other. It is designed to calculate a growth rate or maturity value.

It is possible to specify a projection rate (or multiple) that uses a negative growth rate.

ClientsRisk RatingModellerAnalyserComparatorWeblineProduct & FundTools & CalculatorsSettings

Example TestHelp

Search Clients...

Example Test

Synaptic Comparator

Comparator allows advisers to compare all aspects of the platform market including platform features, funds, tax wrappers and all associated charges, enabling comparison of the overall solution cost for each option.

Costs & Charges Calculator

Calculate projection rates adjusted for extra charges.

Projection Calculator

Calculate a projected maturity value where none currently exists.

Maturity Value Calculator

Calculates target maturity value given a table of projection and growth values.

Critical Yield Calculator

Clear

☒ Critical Yield☐ Maturity Value

Enter 3 growth rates with their maturity values for the new product (you can use Comparator to generate these) and a target maturity value from the existing product to calculate the gross growth rate needed from the new product in order to match the existing product's maturity value - i.e. the critical yield.

Projected Rates

Rate 1

Growth Rate4.00%

Maturity Value£20,000.00

Rate 2

Growth Rate6.00%

Maturity Value£25,000.00

Rate 3

Growth Rate8.00%

Maturity Value£30,000.00

Target Maturity Value£27,000.00

Calculate

Quick Report

The accuracy of this calculator is dependent on the accuracy of the inputs. If you input figures that have been rounded down as per the FCA rounding rules then the critical yield value calculated could include a variance of up to 1%, e.g. if the calculated critical yield value is 7.00% then it could be between 6.93% & 7.07%.

Calculated Growth Rate

6.89%

You must supply 3 points of reference for the calculation. So, 3 gross growth rates & 3 corresponding maturity values. You can then specify either; a target maturity value and the calculator will return a growth rate, or a target growth rate and the calculator will return a maturity value.

www.synaptic.co.uk

You will also be able to produce a report of inputs and results. The calculator estimates the equation of the line that connects the three reference points allowing you to find the values on any other point of that line e.g.

If you supply the value for one of the question marks it will calculate the other for them.

### 3.3.2 Maturity Value

This is designed to allow you to calculate the maturity value if they supply a growth rate.

It is possible to enter a target growth rate that is a negative.

From the example above if 6.89% is used then the resulting maturity value is calculated as £27,014.08 (which would round down to £27,000) i.e. the maturity value we asked for when it calculated the 6.89%

**Maturity Value Calculator**

☐ Critical Yield ☒ Maturity Value

Enter 3 growth rates with their maturity values from the existing product and a target growth rate that you wish to calculate the maturity value for. The maturity value returned will be the maturity value for the existing product at the target growth rate. You can use this to create asset allocated growth rate projections where the provider will not supply projections to you.

**Projected Rates**

Rate 1	Rate 2	Rate 3
Growth Rate: 0.00%	Growth Rate: 0.00%	Growth Rate: 0.00%
Maturity Value: £0.00	Maturity Value: £0.00	Maturity Value: £0.00

Target Growth Rate: 0.00%

The accuracy of this calculator is dependent on the accuracy of the inputs. If you input figures that have been rounded down as per the FCA rounding rules then the maturity value calculated could include a variance of up to 1%, e.g. if the calculated maturity value is £20,000 then it could be between £19,800 & £20,200

Calculated Maturity Value  
**not yet calculated**

This feature can be used for single or multiple plans where you wish to compare different rates from different plans and align them together. I.e. you are researching two plans, one which has supplied figures at 4%, 6% & 8% and the other has used 5%, 7% & 9%.

You can use this calculator to combine both plans figures (by turning the 4%, 6% & 8% to be 5%, 7% & 9% or vice versa) so that they can research switching **both** plans into one as well as looking at them individually.

All figures produced are an approximation and are dependent on the accuracy of the inputs.

This is especially apparent when the numbers used are supplied to 3 significant figures as the exact maturity value could be quite different which would in turn result in a different output. I.e. a maturity value displayed to 3 significant figures of £25,000 could in reality actually be any number up to £25,099.99.

This means that the equation of the line between the points would be different and hence the output would also be different.

Ideally, you would always supply exact figures but in reality, this is not always possible so it may pay to run two calculations that cover the extremes i.e. in the above example, run the calculation with £20,099.99, £25,099.99 & £30,099.99 and maturity value of £27,000 again which results in a growth rate of 6.85%

This means that the critical yield could actually be somewhere between 6.85% and 6.89% making the hurdle rate between 0.85% & 0.89%

## 4 Open Comparator

When you click on “Open Comparator” it will open and enable the functionality defined below.

### 4.1 Generic Fund

When making fund selection you will be able to bypass the need for a portfolio and apply the same fund costs across all products.

You will need to define the net initial and on-going costs of the fund & the growth rate the fund has. It is possible to specify a growth rate for the Generic Fund to be a negative.

The projection will then use the figures supplied across all the products in the comparison.

You will also need to select what type of fund they are representing (internal, external or ETF).

Some providers have specific charges for different fund types and this will ensure the correct charges are applied to the projections.

The use of the generic fund will not filter out any providers.

The screenshot displays the Synaptic Comparator software interface. The top navigation bar includes icons for 'new', 'edit', 'duplicate', and 'delete'. Below this, a breadcrumb trail shows 'Example Test' > 'Features Selected' > 'Results' > 'Final Report'. The left sidebar contains a 'Synaptic Comparator' header and a list of categories: Platforms (24 / 25), ISA, Retirement, SIPP, PP, Existing Plan, Bonds, Onshore, Offshore, Funds, GIA, ISA, Retirement, Onshore bonds, Offshore bonds, Contacts, and Setup. The main content area is titled 'Select Funds' and shows a 'Generic Fund' configuration. The 'Generic Fund' section includes a text box for 'Enter the details below that approximate the fund(s) you wish to compare, you must supply a growth rate and the net costs of both the initial purchase of the fund and its ongoing costs. In addition you can state whether you are using the generic fund to represent a specific type of fund. Some products charge different types of funds in different ways and this will ensure the correct charges are applied in the projection.' Below this, there are input fields for 'single amount' (100000.00), 'net initial cost' (0.00 %), and 'net ongoing cost' (0.75 %). The 'growth rate mode' is set to 'Single growth rate', and the 'growth rate' is 5.00 %. The 'fund type' is set to 'Internal'. The 'Portfolios' section shows a search bar with 'test1' and a list of 2 portfolios available (24 total), including 'Test12345' and 'Test123456'.

This functionality can be used in a number of ways:

1. It allows a comparison of product costs as all the fund charges are the same, assuming your adviser charges are identical across all products.
2. If data for a fund you wish to use is currently not available in Comparator, the generic fund may be used as a substitute to represent this fund assuming you are familiar with all the associated charges applicable to that fund.
3. It can be used to represent a provider's internal funds, only available within their product, which if selected as a portfolio would filter out all providers, except the internal funds of that provider. Assuming you can demonstrate that the costs of these internal funds that they wish to compare the data from are "similar" across those providers funds, they wish to use, then the generic fund can represent various provider fund solutions.

4.2 Existing Plan details

You have the option of supplying figures from an existing pension plan which will then show where the existing plan is ranked compared with what is available in the market on the results screen. In order to enter some figures you need to click on the existing plan section under “Retirement” and then on the “add growth rate” button in the bar at the top.

It is also possible to specify a projection rate (or multiple) that uses a negative growth rate, this will then be replayed in the results assuming the growth rate supplied is the same as the projection undertaken.

You can add as many rates as they have about the existing plan but these will only appear in the results if the projection rate for the results (either manually overridden or asset allocated by fund selection) matches one of the rates already entered in this section.

The existing plan will then appear in the results and be ranked accordingly.

4.3 Stakeholder Comparison

In accordance with the FCA update (RU64), a generic stakeholder comparison is required to accompany all PP and SIPP retirement projections.

This will return a generic Stakeholder in the results whenever a retirement product has been selected for comparison, using charges of 10yrs @ 1.5% p.a. then 1% p.a. thereafter. No other charges apply.

The stakeholder will always appear at the top of the screen and not be ranked with the other results.

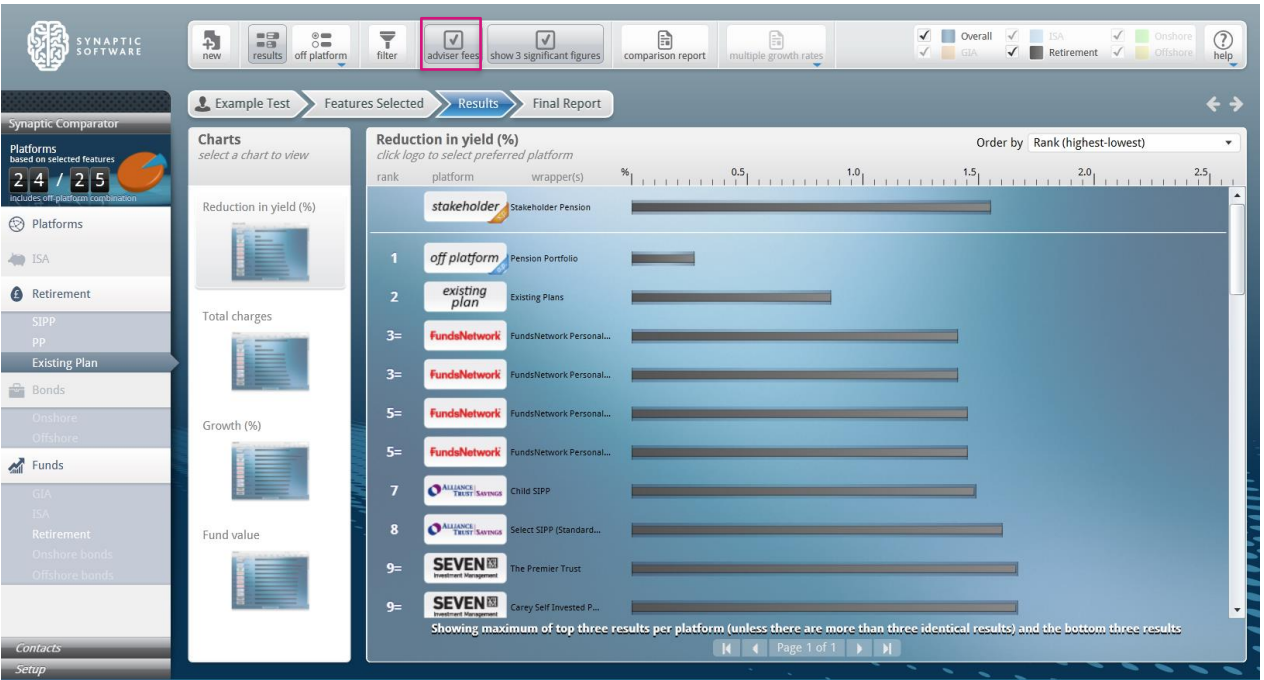

The figures will follow through into the reports.

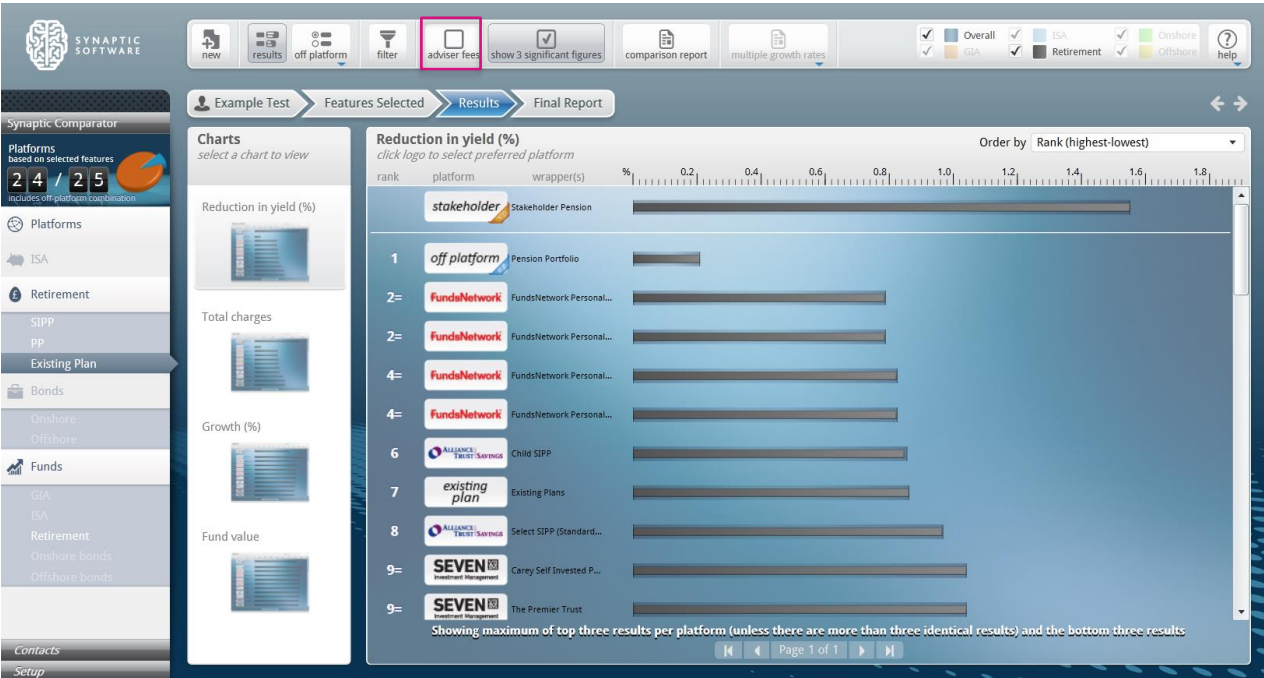

4.4 Adviser Fees Toggle

This function will allow you to remove all adviser fees from a comparison by pressing one button.

(The alternative to this would be to turn all the adviser fees in Setup to 0 and recalculate the comparison).

By unchecking the box the comparison will be recalculate excluding all adviser fees.

The purpose of this functionality is to easily demonstrate the effect of the adviser fees.

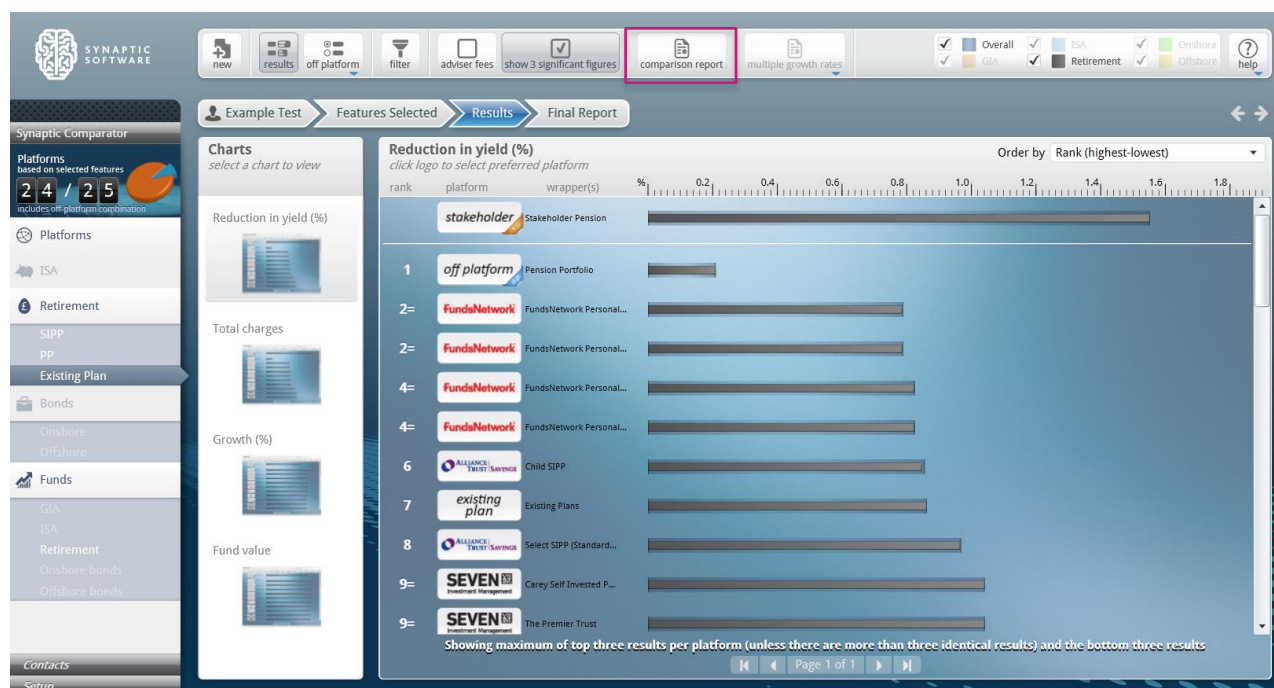

## 4.5 Comparison Report

This function is to allow you to take a snapshot of a set of results.

It is likely that you will be producing lots of different comparisons at different growth rates, different portfolios etc.

This report will allow you to save a report for each of the comparisons they have made. The report will contain the top ten results and the stakeholder figures as well as all the input criteria.

You can produce as many reports as required and all will be stored against the piece of research in the same way the final report is currently.
